(a)
Cavity work versus radius
$N = 108$
$N = 256$
rare-event estimate
$\beta W_N(R) = -\ln P_{0,N}(R)$
cavity radius R/σ
(b)
Running convergence at $R/\sigma = 0.75$
cumulative $\beta W_N(0.75\sigma)$
production block
(c)
Crystalline-order diagnostics
production-block value
